

The Wetland Dashboard has been updated with data from 2023. The wetland dashboard can be accessed here: [Wisconsin Wetland Dashboard | Wisconsin DNR](#).

The wetland dashboard is a quick way to review trends in the amount of wetland filling versus wetland restoration that has occurred over the last three years, and is a good representation of the amount of wetlands avoided through the practicable alternatives analysis that is associated with the wetland permitting process.

A quick summary for 2023 is as follows:

- Permanent Wetland Impact Acres in 2023 (Artificial and nonfederal exemptions + GPs + IPs) = 125 acres
- Wetlands acres restored in 2023 = 190 acres
- 21 acres of permanent wetland impacts avoided through the practicable alternatives analysis process
